CE 311S: Exam 2

Tuesday, November 10

12:30 – 1:45 PM

Name ⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯⎯

Instructions:

- **SHOW ALL WORK** unless instructed otherwise. No shown work means no partial credit!

- If you require additional space, you may use the back of each sheet and/or staple additional pages to the end of the exam.

- If you need to make any additional assumptions, state them clearly.

- You may use one regular-sized sheet of notes. No additional resources are permitted.

- The number of points associated with each part of each problem is indicated.

Problem	Points	Possible
1		20
2		25
3		30
4		25
TOTAL		100

Problem 1. (20 points) To help pay your way through engineering school, you take a new job with a property management company which owns a number of apartments near campus, including a newly-built complex called The Residences at The Lofts at UTWesCam (as all the trendy people are calling West Campus these days), or TRTLUTWC for short. Unfortunately, these trendy new units are built using low-quality materials and a number of corners were cut during construction. Fortunately for you, the sleek marketing and convenience of nearby restaurants such as the Ham Palace mean that many students still want to live here. After several weeks of working in the front office, you notice that the number of prospective tenants asking for information each day (call this X) can be approximated well by the PDF $f_X(x) = \frac{1}{32}\exp(-x/32)$ for $x \geq 0$, and $f_X(x) = 0$ otherwise.

(a) (5) What is the probability that the number of prospective tenants tomorrow is between 24 and 40?

(b) (5) What is the mean and standard deviation of the number of tenants who will stop by tomorrow?

(c) (5) What is the mean and standard deviation of the *average* number of tenants who will stop by in the next 100 days?

(d) (5) What is the probability that the *average* number of tenants in the next 100 days will be greater than 36?

Problem 2. (25 points) After a few embarassing incidents with potential tenants you are transferred to maintenance operations. Thankfully for you, the management does not take maintenance requests very seriously so you never have to spend very long on any repairs. You are assigned to work with two kinds of repairs: broken air conditioners, and leaking windows. Because of your 311S experience, you quickly realize that the joint probability mass function of the number and type of repairs you make in a given day are as follows:

		Broken A/C (A)		
		0	1	2
	0	0.15	0.10	0.05
Leaky windows (B)	1	0.10	0.20	0.10
	2	0.05	0.05	0.20

(a) (10) What are the marginal PMFs of A and B?

(b) (5) In a typical day, what is the expected number of repairs you are assigned in total?

(c) (5) Each air conditioning repair takes you 20 minutes, and each leaky window repair takes 25 minutes. How much time do you expect to spend each day on repairs?

(d) (5) Are the number of air conditioning repairs and leaky window repairs independent? Explain your answer, do not just say yes or no.

Problem 3. (30 points) Maintenance isn't working so well for you either, so they send you to the marketing department. TRTLUTWC has two primary avenues for advertising: fake reviews on Yelp, and fake posts on Reddit. You are assigned to create a number of new accounts on these sites and leave glowing reviews of the property and management. Let Y be the rate at which you make Yelp posts per week, and R the rate of Reddit posts. Suppose that Y and R are continuous random variables with joint density $f_{Y,R}(y,r) = k(y+r^2)$ if $0 \le y \le 2$ and $0 \le r \le 6$, and zero otherwise, where k is an appropriate constant.

(a) (10) What is the value of k?

(b) (10) What is the probability you make Reddit posts at a rate of more than 3 per week?

(c) (10) What is the expected rate of your Yelp posts?

Extra credit: Provide a sample of a fake Yelp review for TRTLUTWC. 5 bonus points to the best response in the class, 3 to a runner up.

Problem 4. (25 points) Unfortunately your social media posts were transparently fake, so you are permanently banned from those services. As a last ditch measure, your supervisor assigns you to the menial task of calculating fees assessed to potential tenants. Every potential tenant must pay an application fee, and a credit check fee. You weren't paying attention when you were told how much to charge, so you just charge each tenant a random amount for each fee. It turns out that the amounts for all of the fees you charge are independent, identically-distributed lognormal random variables with $\mu = 4.5$ and $\sigma = 1$.

(a) (5) What is the mean of the total fees charged to a potential tenant?

(b) (10) Assume that the standard deviation of the total fees charged is $50. What is the correlation coefficient between the application fee and credit check fee?

(c) (10) What is the 20th percentile credit check fee you charge?

Table A.3   Standard Normal Curve Areas

$\Phi(z) = P(Z \le z)$

Standard normal density curve

Shaded area $= \Phi(z)$
