

## CE 311S: Exam 2

Friday, April 1

9:00 – 9:50 AM

Name \_\_\_\_\_

### Instructions:

- **SHOW ALL WORK** unless instructed otherwise. No shown work means no partial credit!
- If you require additional space, you may use the back of each sheet and/or staple additional pages to the end of the exam.
- If you need to make any additional assumptions, state them clearly.
- You may use a calculator and one regular-sized sheet of notes. No additional resources are permitted.
- The number of points associated with each part of each problem is indicated.

Problem	Points	Possible
1		30
2		35
3		35
<b>TOTAL</b>		100

**Problem 1.** (30 points) You are inspired to take up cooking as a hobby. Unfortunately, you don't have much past experience, so you go to YouTube to try to find instructions. You come across a channel that may be helpful. Unfortunately the videos are mostly clickbait, and you end up watching a bunch of videos to learn anything. (Perhaps titles like "Top 8 Secret Ingredients Guaranteed to Impress Your Friends... #2 will warm your heart, #7 will blow your mind" should have been a clue.) Most of the recipes involve flour, and you are concerned about how much you will have to spend.

- (a) (15) The price of flour in any given week is uniformly distributed between \$0.5 and \$1 per pound. Write the PDF for this distribution, and calculate its mean and standard deviation.
- (b) (15) You end up buying a pound of flour every week for the next 36 weeks. What are the mean, standard deviation, and 95th percentile for the *average* price per pound that you will pay over these weeks?

**Problem 2.** (35 points) You obtain a copy of Julia Child's *The Art of French Cooking*, with the intent of making croissants from scratch. However, seeing that the recipe is 8 pages long<sup>1</sup>, you instead turn to the Internet and find two recipes online. You decide to select the recipe which has been viewed the most times; the number of views for recipes on this site (measured in thousands) are independent and exponentially distributed with a mean of 3. Let  $X$  and  $Y$  denote the number of views for the two croissant recipes, in thousands.

- (a) (5) What is the standard deviation of  $X$ ?
- (b) (5) What is the median of  $X$ ?
- (c) (5) What is  $\rho_{XY}$ ?
- (d) (5) Let  $W$  denote the number of views on the recipe you select (also measured in thousands). What is  $P(W < 4)$ ? (Hint: since you choose the recipe with more views, this means that *both* recipes had fewer than 4000 views).
- (e) (5) What are the mean and standard deviation of the *sum* of the views for the two videos?
- (f) (10) What is the probability that the sum of the views for the two videos is over 9000?

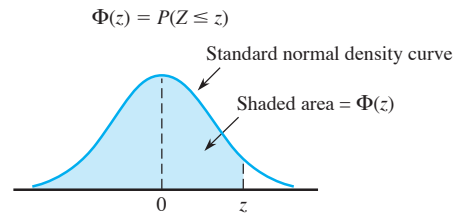

---

<sup>1</sup>This is true.

**Problem 3.** (35 points) You eventually gain confidence and host a series of dinner parties over the rest of the semester. Let  $X$  denote the amount of food you prepare, and  $Y$  the amount of food your guests want to eat (both measured in pounds). Assume that  $X$  and  $Y$  are independent, with  $X$  uniformly distributed between 3 and 5, and  $Y$  uniformly distributed between 4 and 6.

- (a) (5) Write the joint PDF for  $X$  and  $Y$ .
- (b) (10) What are  $E[X]$  and  $V[X]$ ?
- (c) (10) What are  $E[2X - 3Y]$  and  $V[2X - 3Y]$ ?
- (d) (10) What is the probability that you have leftovers? (i.e., you prepare more food than your friends want to eat.)
