CE 311S: Final exam

Tuesday, May 15

2:00 – 5:00 PM

Name ____

Instructions:

- **SHOW ALL WORK** unless instructed otherwise. No shown work means no partial credit!
- If you require additional space, you may use the back of each sheet and/or staple additional pages to the end of the exam.
- If you need to make any additional assumptions, state them clearly.
- You may use one regular-sized sheet of notes; please turn in the notes with your exam. No additional resources are permitted.
- The number of points associated with each part of each problem is indicated.
- All necessary tables are attached.

Problem	Points	Possible
1		20
2		20
3		15
4		15
5		15
6		15
TOTAL		100

Problem 1. (20 points). Wanting a piece of the scooter sharing action, you and your friends form a startup called UT-Scooty. Your idea is to flood campus with cheap, disposable (and biodegradable!) scooters at such a rate that UT Parking and Transportation Services cannot impound them all.[1] In this way you can continue to operate without having to obey UT regulations. As a starting point, you and your friends collect data on the number of Bird and LimeBike scooters which were used during a six-day random sample earlier in the semester.

102 88 125 85 90 97

For each of the following, find ***intervals*** which you are 95% sure contain the requested values. Assume that these numbers are normally distributed.

(a) (5) The number of scooters which will be used in any given day.

(b) (5) The mean number of scooters used per day.

(c) (5) The standard deviation in the number of scooters used per day.

(d) (5) The number of scooters which will be used in 99% of the days.

[1] This happens to be very similar to *predator satiation*, the same evolutionary strategy used by cicadas and other insects, which simultaneously erupt in numbers so huge that predators simply get full and stop eating them.

Problem 2. (20 points). UT-Scooty has a soft launch over the sumer. During this time you collect data about the number of accidents reported due to scooter malfunctions, likely due to choosing your shady brother-in-law's fabrication company to build the scooters. In particular, you notice that each day, you see an average of 3 accidents. After any day in which more than 5 accidents occur, the Daily Texan will run an article criticizing UT-Scooty; after three such articles, the resulting lawsuits will force you to shut down. For each of the following random variables, indicate the *name of the distribution family*, its *mean*, and its *variance*. If you need to make additional (reasonable) assumptions for this problem, state what they are.

(a) (5) The number of accidents per day.

(b) (5) The time between accidents.

(c) (5) The average number of accidents over the next 100 days.

(d) (5) The number of days UT-Scooty will operate before shutting down.

Problem 3. (15 points). You poll a large number of students about how many times per week they use UT-Scooty, giving the following results:

Times per week	0	1	2	3	4
Percent of responses	40	30	10	10	10

(a) (5) What is the expected number of times a student uses UT-Scooty each week?

(b) (5) What is the standard deviation of the number of times a student uses UT-Scooty each week?

(c) (5) Repeat parts (a) and (b), *excluding students who never use the service* (those who answered 0).

Problem 4. (15 points). You now use the same survey data from Problem 3 to decide whether to expand UT-Scooty to Texas A&M University; you will launch there only if you are very sure that at least 25% of students are frequent users (defined as students who use the service *at least twice per week*). Assume that $n = 100$ for your survey.

(a) (2) What are your null and alternative hypotheses?

(b) (3) State what Type I and Type II errors are for this problem, without using any mathematical or statistical jargon.

(c) (5) Do you decide to expand to A&M? Use a significance level of 5% for your test.

(d) (5) What is the smallest proportion of frequent users for which you would decide to expand service?

Problem 5. (15 points). As the summer goes on, you suspect there might be a relationship between the temperature (measured in Fahrenheit) and the number of customers. You have collected the following data:

Temperature	85	87	91	95	114
Riders	58	54	63	84	25

(a) (5) What is the best-fit line relating ridership to temperature?

(b) (5) What is the R^2 value?

(c) (5) If it is 94 degrees, what is the probability that there are more than 60 riders?

Problem 6. (15 points). For each month, you must calculate the profit for UT-Scooty: the revenue, minus the costs of scooter purchases and fines from UT (Parking and Transportation Services is not convinced by your argument that, being biodegradable, they are actually adding nutrients to the soil and adding value to UT). The mean and standard deviation for these quantities are as follows: for revenue, \$1000 and \$500; for purchase costs, \$300 and \$200; and for fines, \$800 and \$500. First assume that these three values are independent of each other.

(a) What is your monthly expected profit?

(b) What is the standard deviation of your monthly profit?

(c) Repeat parts (a) and (b) if The correlation coefficient between revenue and purchase costs is $+0.5$; between revenue and fines is -0.1; and between purchase costs and fines is $+0.4$
